19-FOOT PRESSURE TUNNEL
RESEARCH MEMORANDUM
for the
U. S. Air Force

SUMMARY

Development tests on a 1/4-scale model of the Republic F-105 airplane are being conducted in the Langley 19-foot pressure tunnel.

The initial tests, the results of which are presented herein, were made at a Reynolds number of 9.0×10^6 and a corresponding Mach number of 0.20 on the model equipped with a supersonic-type elliptical wing-root inlet. Included in the present paper are the results of the following:

- (1) Longitudinal stability and control tests of the basic design provided by the contractor
- (2) Tests of various modifications designed to improve the stability characteristics of the model with the trailing-edge flaps deflected
- (3) Brief exploratory lateral-control and rudder-effectiveness tests
- (4) Stall studies and duct air-flow measurements

In order to expedite the issuance of the data for this airplane, no analysis of the results has been made.

INTRODUCTION

The F-105 airplane is a 45° sweptback, midwing, low-tail, supersonic fighter-bomber being developed by the Republic Aviation Corporation for the United States Air Force. At the request of the Air Force, development tests on a 1/4-scale model of the F-105 are being conducted in the Langley 19-foot pressure tunnel to determine the low-speed aerodynamic characteristics of the basic design and, if necessary, to develop modifications which will provide the model with satisfactory low-speed stability and control characteristics.

The initial tests, the results of which are presented herein, were primarily concerned with the low-speed longitudinal stability and control of the model equipped with a supersonic-type elliptical wing-root inlet with and without various high lift and stall-control devices. In addition to the longitudinal stability and control investigation, brief exploratory lateral-control and rudder-effectiveness tests were made and the results are included. The tests were carried out at a Reynolds number of 9.0×10^6 and a corresponding Mach number of 0.20 through an angle-of-attack range from -4° to 29° .

In order to expedite the issuance of the data for this airplane, no analysis has been made.

COEFFICIENTS AND SYMBOLS

c_L lift coefficient, $\frac{\text{Lift}}{qS}$

c_D drag coefficient, $\frac{\text{Drag}}{qS}$

c_m pitching-moment coefficient (an additional subscript denotes moment center), $\frac{\text{Pitching moment}}{qSc}$

c_n yawing-moment coefficient (an additional subscript denotes moment center), $\frac{\text{Yawing moment}}{qSc}$

c_y side-force coefficient, $\frac{\text{Side force}}{qS}$

~~CONFIDENTIAL~~
MODEL

Model Description

The model was primarily of steel-reinforced wood construction; however, the inlets, trailing-edge flaps, leading-edge flaps, and lateral-control spoilers were aluminum. The model and the geometric characteristics presented herein were supplied by Republic and have not been checked for accuracy.

Basic model.- The basic model for the longitudinal stability and control tests was a 1/4-scale replica of the F-105 airplane wing, fuselage, and vertical tail equipped with a supersonic-type elliptical wing-root inlet. Principal dimensions and design features of the model and a photograph of the model installed in the Langley 19-foot pressure tunnel can be found in figures 1 to 4 and table I.

Horizontal tail.- The original horizontal tail (see fig. 1 and table I) could be set at tail incidences of 0° and -3° (relative to the fuselage center line) at tail heights of $0.057b/2$ and $0.090b/2$ below the mean-aerodynamic-chord plane extended. At a tail height of $-0.123b/2$, tail incidences of 7° , 3.5° , 0° , -3.5° , -7° , -14° , -20° , and -25° were available. A tail having the same plan form as the original tail, but incorporating modified NACA 1-series airfoil sections (see table II) was tested at tail incidences of 0° , -3.5° , -7° , and -14° at the $-0.123b/2$ position.

Trailing-edge flaps.- The wing was equipped with a single slotted trailing-edge flap which extended spanwise from the fuselage to 80 percent of the wing semispan (see fig. 5(a) and table I). Flap deflection angles of 0° , 35° , and 46° in a plane perpendicular to the flap hinge line were obtained through the use of interchangeable steel positioning brackets. For some of the tests the flap span was reduced from 80 to 60 percent of the wing semispan.

Stall-control devices.- An inversely tapered drooped leading-edge flap with interchangeable deflection brackets of 0° , 20° , and 30° in a plane perpendicular to the hinge line was originally provided to serve as a stall-control device. For some of the tests this flap was cut and the outboard and inboard halves were deflected differentially. Chord-extensions of various spans having leading-edge radii of $0.0091\bar{c}$ and extensions of 15 percent of the local streamwise chord, and wing fences having heights of 2.54 and 5.12 percent of the mean aerodynamic wing chord were also tested as stall-control devices. Details of the various devices can be found in figure 6 and table I.

~~CONFIDENTIAL~~

Speed brakes. - Speed-brake panels were provided at the rear end of the fuselage (see fig. 7(b) and table I). These panels could be attached at 30° and 45° deflection in the vertical plane and 26.7° and 40° in the horizontal plane.

External stores. - For some of the tests, external stores representative of 450-gallon pylon-mounted wing tanks were attached at the 0.606b/2 station. Details of the stores with and without stability fins can be found in figure 7(a) and table I.

Lateral-control spoiler. - A flap-type lateral-control spoiler was attached to the upper surface of the left wing. This spoiler extended spanwise from the fuselage to 70 percent of the wing semispan and could be deflected 61° in a plane perpendicular to its hinge line. Because of the abrupt change in wing contour at the 0.382b/2 station, a small gap was provided to permit deflection of the spoiler. Additional details of the spoiler can be found in figure 5(b) and table I.

Model Nomenclature

Listed below are the designations given to the various component parts of the model. Details of the various components may be found in figures 1 to 7 and tables I and II. The complete model configurations are obtained by combining the appropriate model components with the basic model.

- A basic model (wing plus fuselage)
- B speed brakes
 - first subscript: vertical deflection, deg
 - second subscript: horizontal deflection, deg
- C chord-extension
 - suffix: span (fraction of wing semispan)
- E external stores
 - prefix: Δ indicates 41.16 sq in. half-delta fin added to outboard side of each store
 - 15Δ indicates leading edge of fin is deflected 15° relative to the store center line
 - subscript: 0 indicates outboard location (0.606b/2)
 - suffix: 450 indicates 450-gallon fuel tank
- F single slotted trailing-edge flap
 - prefix: flap span (fraction of wing semispan)
 - superscript: 1 indicates flap inflector door open
 - subscript: deflection, deg

- I wing-root inlet
 subscript: SE indicates supersonic-type elliptical inlet
- N inversely tapered droop leading-edge flap
 subscript: deflection, deg
 suffix (used when only a portion of the flap is deflected):
 span (fraction of wing semispan)
- R deflected rudder
 subscript: deflection, trailing edge right for positive
 deflection, deg
- S flap-type lateral-control spoiler (left wing only)
 subscript: deflection, deg
- T horizontal tail
 (primed T indicates modified airfoil section - see table II)
 prefix: vertical position (fraction of wing semispan)
 subscript: incidence, trailing edge down for positive
 deflection, deg
 suffix: (end plate) - plate with height of 4 times maximum
 thickness of horizontal tail, attached at juncture of hori-
 zontal tail and fuselage

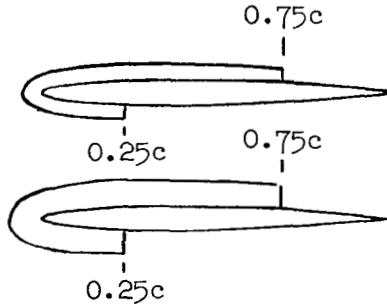

V vertical tail

W wing fence
 prefix:

1 indicates height equals
2.54 percent of mean
aerodynamic chord

2 indicates height equals
5.12 percent of mean
aerodynamic chord

subscript: spanwise position (fraction of wing semispan)

TESTS

All tests reported herein were conducted in the Langley 19-foot pressure tunnel at a tunnel pressure of approximately $2\frac{1}{3}$ atmospheres. A Reynolds number, based on the mean aerodynamic chord, of 9.0×10^6 and a corresponding Mach number of 0.20 were maintained throughout the

investigation. The model was mounted on the normal three-support system at 0° angle of yaw and was tested through an angle-of-attack range of -4° to 29° , except when limited by physical interference between the extended speed brakes and the support system.

Longitudinal characteristics of the model with and without various horizontal-tail arrangements, high-lift and stall-control devices, external stores, and speed brakes were obtained. Lateral-control characteristics of the flap-type spoiler aileron were investigated at only one spoiler deflection with and without drooped leading-edge and trailing-edge flaps. In addition, the effectiveness of the rudder was measured at one rudder deflection.

CORRECTIONS

Jet-boundary corrections determined by the method of reference 1 have been applied to all force and moment data. Rolling-moment, side-force, and yawing-moment coefficients have been corrected for model and air-stream asymmetry. Corrections for support tare and interference effects and for air-flow misalignment have not been applied. Internal drag of the inlets and duct system is included in the drag data presented herein.

PRESENTATION OF DATA

The results of the longitudinal stability and control investigation of the 1/4-scale model of the Republic F-105 airplane are summarized in table III. Details of the test results may be found in figures 8 to 20 for the basic design and figures 21 to 33 for the model equipped with various modifications intended to improve the flap-down stability of the basic design.

The results of the brief exploratory lateral-control and rudder-effectiveness tests are contained in figures 34, 35, and 36.

Stall studies, duct air-flow effects on the longitudinal stability characteristics, and duct air-flow measurements are presented in figures 37 to 40.
